

Costs, not signal quality, decide the outcome

Gross +7.77%, net -4.77%: TRY 12,404 of modelled costs on 123.7x turnover. The flat stretches are sessions with no position: expected net return was non-positive for every eligible name, so the strategy holds risk on only 62 of 120 sessions (52%). Any figure annualised as if the capital were continuously deployed therefore overstates the deployment.
